Database access -- Skyline Realtor (for markers)

Use this page together with **RealEstateManagementSystem/appsettings.json** (web) and the **DesktopApp** source (desktop connection strings in the forms). If credentials do not match your environment, **ask the developers** who submitted this package.

Web application

- **Setting name:** DefaultConnection
- **File:** RealEstateManagementSystem/appsettings.json

Example (Docker SQL Server on the same machine)

```
Server=localhost,1433;Initial Catalog=RealEstateDB;User  
Id=sa;Password=RealEstate_local_1;Encrypt=True;TrustServerCertificate=True;
```

Field	Value
Server	`localhost,1433` (see repo root `docker-compose.yml` for the host port)
Database	`RealEstateDB`
Login	SQL authentication
User	`sa`
Password	Must match `MSSQL_SA_PASSWORD` in `docker-compose.yml` (example above)

First-time Docker setup: From repo root: `docker compose up -d`, then run `./scripts/init-docker-db.sh`, then `dotnet run` from the web project folder.

Lab or remote SQL

Replace **Server**, **Initial Catalog**, **User Id**, and **Password** with what your institution or the group provided. Prefer a **grading-only** SQL login if the package is shared.

Desktop application

Connection strings are in **DesktopApp/*.cs** (login and data forms). For final submission they should usually match the same **Server** / **database** / **user** / **password** as the web app. If the desktop shows demo or offline behaviour, confirm with the **developers** what the lecturer should use for assessment.

Backup and schema

File	Purpose
`uploads/RealEstateDB_Backup.bak`	Full backup -- restore in SSMS
`uploads/database_schema.sql`	DDL reference
`docker/init/01-realestate.sql`	Script used with the optional Docker workflow

Technology

- **Database:** Microsoft SQL Server (`Microsoft.Data.SqlClient`)
 - **Web:** ASP.NET Core (see `RealEstateManagementSystem.csproj`)
 - **Desktop:** Windows Forms (`DesktopApp/DesktopApp.csproj`)
-

Windows Authentication (only if the group submitted that way)

If the marker runs on a domain-joined PC and SQL is set up for Windows auth, a typical pattern is:

```
Data Source=YOUR_SERVER_NAME;Initial Catalog=RealEstateDB;Integrated Security=True;Encrypt=True;TrustServerCertificate=True;
```

This is **not** suitable for anonymous cloud hosts; use SQL login instead.
